Here I'm going to share with you an approach of how to use Angular CLI locally without having the global installation of it. I've been using this way of utilizing the CLI for some time and I really love it.

Step 1: Uninstall the global version of the CLI

```
npm uninstall -g @angular/cli
```

Step 2: Use `npmx` to create a new project

```
npx -p @angular/cli ng new hello-world
```

`npx` will download the `@angular/cli` package.

BTW, `npx` goes with the `npm` installation.

Step 3: Run the `ng` command using `npx`

```
npx ng generate component my-component
```

So, here the `npx` is smart enough again! It finds out that the `ng` command exists locally in `./node_modules/.bin/` directory and runs it.

That's it and happy coding!
